```
2018.03.15. - 016일차 수업
```

* Memory Pool 방식의 큐(Queue)

헤더파일 및 매크로 추가

```
#include <stdio.h>
#include <stdib.h>
#include <stdbool.h>
//필요에 따라 배열 크기 더 늘려서 사용
#define STRUCT_ARR_LEN 1000
```

데이터 타입과 Queue 구조체 정의

```
typedef int Data;
typedef struct _Queue{
   struct _Queue* next; //다음 Queue 구조체
   unsigned int structIndex;//데이터 구조체index
   unsigned int structFirstData;//Queue데이터출구
   unsigned int structLastData;//Queue데이터입구
   Data data[STRUCT_ARR_LEN]; //데이터 배열
}Queue;
```

Queue 구조체 초기화 후 반환 함수

```
Queue* getNewQueue(){
    Queue* newQueue =
    (Queue*)malloc(sizeof(Queue));
    newQueue->next = NULL; //다음 Queue 구조체
    newQueue->structFirstData = 1;
    newQueue->structLastData = 0;
    newQueue->structIndex = 0;
}
```

Insert Queue 함수

```
void insertQueueData(Queue** Node, Data data) {
    //들어온 노드가 Null인 경우
    if(!(*Node)) {
        *Node = getNewQueue();
    }
    Queue* tmp = *Node;
    unsigned int structNum = (*Node)->structIndex;
    //tmp->next 값이 NULL일 때 까지 while 루프
계속 돌림 (마지막 구조체 찾기)
    while(tmp->next) {
        structNum++;
        tmp = tmp->next;
    }
    //마지막 구조체에 더이상 공간이 없을 경우 ->
tmp값을 새로운 구조체 주소값으로 넘어가도록 만듬
```

```
if(tmp->structLastData == STRUCT_ARR_LEN -

1 ){

    tmp->next = getNewQueue();
    tmp = tmp->next;
    tmp->structIndex = structNum + 1;
    }

    //실제 insert 과정
    tmp->structLastData++;
    tmp->data[tmp->structLastData] = data;
}
```

Print Queue 함수

```
void printQueueData(Queue** Node){
    Queue* tmp = *Node;
    //들어온 노드가 Null인 경우
    if(!Node)
        return;
    while (tmp){
        for (int i = 0; i < tmp->structLastData;
    i++){
            printf(" %d ", tmp->data[i + 1]);
        }
        tmp = tmp->next;
    }
}
```

Pop Queue 함수

```
Data popQueueData(Queue** Node){
   //들어온 노드가 Null인 경우
   if(!(*Node)){
      printf("Queue is empty!\mun");
      return -1;
   }
   Queue* tmp = *Node;
   Data popData;
   unsigned int structNum = tmp->structIndex;
   //구조체에 데이터가 하나밖에 없을 경우
   // -> 데이터 반환 후 구조체 삭제하고 tmp값을
이전 구조체 주소값으로 넘어가도록 만든다
   if(tmp->structFirstData == tmp-
>structLastData ){
      popData = tmp->data[tmp->structFirstData];
      //구조체가 하나밖에 없는 경우 (다음 구조체
없음) -> 구조체 초기화
      if(!tmp->next){
          tmp->structFirstData = 1;
          tmp->structLastData = 0;
      }
       //다음 구조체가 존재 할 경우
      else{
          *Node = (*Node) -> next;
          free(tmp);
      //tmp->next 값이 NULL일 때 까지 while 루프
계속 돌림
       tmp = *Node;
      while (tmp->next){
```

```
tmp->structIndex--; //모든 구조체
index 1씩 감소

tmp = tmp->next;

}

//구조체에 데이터가 비어있을 경우
else if(tmp->structLastData == 0){
 printf("Queue is empty!\n");
 return -1;
}

//구조체에 데이터가 2개 이상 있을 경우
else{
 popData = tmp->data[tmp->structFirstData];
 tmp->structFirstData++;
}
return popData;
}
```

테스트용 Main 함수

```
int main(){
                               Queue* Queue1 = NULL;// getNewQueue();
                                insertQueueData(&Queue1,10);
                                insertQueueData(&Queue1,20);
                                insertQueueData(&Queue1,40);
                                insertQueueData(&Queue1,70);
                                insertQueueData(&Queue1,44);
                              printQueueData(&Queue1);
                              printf("₩n%d\n" ,popQueueData(&Queue1) );
                            printf("\u00cmn\u00fm\u00cd\u00fm\u00cd\u00fm\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00cd\u00
                              printf("\nother m\nother 
                              printf("\mathbb{\text{W}n\mathbb{\text{M}}d\mathbb{\text{W}n\"} ,popQueueData(&Queue1) );
